

With special thanks to Alfredo Canziani I am proud to be able to present:

[The final release of Frequency Tuner 2.0!](#)

This new version of Frequency Tuner is the first new release since almost 5 years. The reason for the silence is the lack of a suitable Windows Mobile device to test with, and of course enough time to spend on the implementation and testing of the new features.

Version 2.0 includes besides a lot of improvements to the native measurement method some new functionality:

- Smartphone support
- FFT measurement support
- FFT spectrum view
- Tune Track view
- New menu with full support/keys for non-touchscreen devices and all dialogs
- New advanced settings added
- Trigger Backlight on measurement
- Support for displaying alternate notenames: C=Do,D=Re,E=Mi,F=Fa,G=Sol,A=La,B of H=Si,Do (b and #, es / is)

For more information [see the release notes](#) .

For for I would like to see some people who whould like to test the new version, to see if additional bugfixing is needed.

Regards,

Frequency Tuner 2.0 released!
